

CYCLONEDRY

FEATURES

All plant material contains water. During an extraction process, that water may transfer to your solvent (Butane) and can ruin your recovery pump. The only way to stop this damage from occurring is a filter dryer. Most refrigerant recovery pumps are not well suited for solvent recovery because they require solvent to be moved as a liquid for lubrication purposes. When the solvent is a liquid, as water is, it will move along with the gas and destroy your pump in the process.

The CycloneDry will eliminate this problem, leaving vapor solvent to pass through your pump. This occurs in two ways: 1) the CycloneDry acts as a form of a cold trap, capturing water and water vapor, and 2) the core absorbs liquid water, allowing your solvent to pass through filtered.

Each core is reusable, simply bake out the core in an oven and reuse it over and over.

- ▶ Reusable filter core: can be baked out and reused
- ▶ Filtration: 40 microns
- ▶ Fittings: 0.5" JIC
- ▶ Designed specifically for botanical extraction in a CLS (Closed Loop System)
- ▶ Our VaporSartz comes standard with two Catch-All Cartridges which are great for smaller applications: processing 1-3 lbs. (as seen in the 1st chart below). The PDX.GOLD CycloneDry is designed for much larger applications, as seen in chart #2.
- ▶ VaporSartz can be connected to any number of CycloneDry filters in order to accommodate any amount of product you plan to process.
